A FRACTIONAL LAPLACE EQUATION: REGULARITY OF SOLUTIONS AND FINITE ELEMENT APPROXIMATIONS

GABRIEL ACOSTA AND JUAN PABLO BORTHAGARAY

ABSTRACT. In this work we deal with the Dirichlet homogeneous problem for the integral fractional Laplacian on a bounded domain $\Omega \subset \mathbb{R}^n$. Namely, we deal with basic analytical aspects required to convey a complete Finite Element analysis of the problem

\[
\begin{cases}
(-\Delta)^s u = f \text{ in } \Omega, \\
u = 0 \text{ in } \Omega^c,
\end{cases}
\]

where the fractional Laplacian of order $s$ is defined by

\[
(-\Delta)^s u(x) = C(n,s) \text{ P.V.} \int_{\mathbb{R}^n} \frac{u(x) - u(y)}{|x-y|^{n+2s}} dy
\]

and $C(n,s)$ is a normalization constant.

Independently of the Sobolev regularity of the source $f$, solutions of (1) are not expected to be in a better space than $H^{s+\min\{s,1/2-\epsilon\}}(\Omega)$ (see [2, 4]). However, by building on Hölder estimates developed in [3], we were able to obtain further regularity results in a novel framework of weighted fractional Sobolev spaces, leading to a priori estimates in terms of the Hölder regularity of the data [1].

After developing a suitable polynomial interpolation theory in these weighted fractional spaces, optimal order of convergence in the energy norm for the standard linear finite element method is proved for graded meshes. Numerical experiments are in agreement with our theoretical predictions, and illustrate the optimality of the aforementioned estimates.

Keywords: Fractional Laplacian, Finite Elements, Weighted Fractional Norms, Graded Meshes
