NUMERICAL SOLUTION OF AXISYMMETRIC EDDY CURRENT PROBLEMS WITH HYSTERESIS

ALFREDO BERMÚDEZ¹, <u>DOLORES GÓMEZ¹</u>, RODOLFO RODRÍGUEZ², AND PABLO VENEGAS³

ABSTRACT. This work deals with the mathematical analysis and the computation of transient electromagnetic fields in nonlinear magnetic media with hysteresis [1]. This means that the constitutive relation between \mathbf{H} and \mathbf{B} is given by a hysteresis operator, i.e., the values of the magnetic induction depend not only on the present values of the magnetic field but also on its past history.

We assume axisymmetry of the fields and then we consider two kinds of boundary conditions. Firstly the magnetic field is given on the boundary (Dirichlet boundary condition). Secondly, the magnetic flux through a meridional plane is given, leading to a non-standard boundary-value problem. For both problems, an existence result is achieved under suitable assumptions. For the numerical solution, we consider the Preisach model as hysteresis operator, a finite element discretization by piecewise linear functions, and the backward Euler time-discretization.

We report a numerical test which allows us to assess the order of convergence of the proposed numerical method. Finally, we validate the numerical scheme with experimental results. With this aim, we consider an industrial application: the numerical computation of eddy current losses in laminated media as those used in transformers or electric machines.
