A PDE APPROACH TO SPACE–TIME FRACTIONAL PARABOLIC PROBLEMS

RICARDO H. NOCHETTO, ENRIQUE OTÁROLA, AND ABNER J. SALGADO

Abstract. We study solution techniques for parabolic equations with fractional diffusion and Caputo fractional time derivative, the latter being discretized and analyzed in a general Hilbert space setting. The spatial fractional diffusion is realized as the Dirichlet–to–Neumann map for a nonuniformly elliptic problem posed on a semi–infinite cylinder in one more spatial dimension. We write our evolution problem as a quasi-stationary elliptic problem with a dynamic boundary condition. We propose and analyze an implicit fully–discrete scheme: first–degree tensor product finite elements in space and an implicit finite difference discretization in time. We prove stability and error estimates for this scheme.

Keywords: Fractional derivatives and integrals, fractional diffusion, weighted Sobolev spaces, finite elements, stability, anisotropic estimates, fully-discrete methods.
